

Laserworld Pure Micro Series - High Power in a Small Housing

Downsizing is not only a term of the automotive industry, but also applies for show laser systems nowadays. The times of truckloads of equipment for one single laser systems are gone.

Laserworld has launched the new Pure Micro Series, that is only "a hand full of laser" : With a size of 18.6 x 16.5 x 12.5cm, these units are very small and at the same time extremely strong.

Up to 2.3W RGB, 6W green and incredible 10W blue can be supplied in this new system. Together with the very accurate 50kpps Xscan Galvos, this unit is perfect for beam shows, graphics and even more advanced advertisement applications.

It is possible to extend even the possibilities by upgrading the units to CT-6210HP scanners for high professional use.

Professionals also like the option to individually balance every single color by trim pots on the rear side of the projector. High precision is decisive for proper graphics scanning, but also for better beam visibility. The PM-1300RGB and the PM-1800RGB come with special beam shaping optics and collimation to ensure incredibly good visibility and accuracy.

Head to the Laserworld booth at Hall E2, Booth G21 to see more.
